Using techniques we will study in this course (see §3.2, Chapter 3), we will discover that the general solution of this equation is given by the equation $x = Aekt$, for some constant A. We are told that $x = 50$ when $t = 0$ and so substituting gives $A = 50$. Thus $x = 50ekt$.

A Text Book of Differential Equations - N. M. Kapoor ...

In mathematics, a differential equation is an equation that relates one or more functions and their derivatives. In applications, the functions generally represent physical quantities, the derivatives represent their rates of change, and the differential equation defines a relationship between the two. Because such relations are extremely common, differential equations play a prominent role in many disciplines including engineering, physics, economics, and biology. The study of differential equa

ELEMENTARY DIFFERENTIAL EQUATIONS

An ordinary differential equation (ode) is a differential equation for a function of a single variable, e.g., $x(t)$, while a partial dif- ferential equation (pde) is a differential equation for a function of several variables, e.g., $v(x,y,z,t)$. An ode contains ordinary derivatives and a pde contains partial derivatives.
