Anabolic Drug Therapy in Osteoporosis | SpringerLink

In men, osteoporosis might be linked with a gradual age-related decline in testosterone levels. Testosterone replacement therapy can help improve symptoms of low testosterone, but osteoporosis medications have been better studied in men to treat osteoporosis and thus are recommended alone or in addition to testosterone.

Anabolic Steroids in the Treatment of Osteoporosis

Intermittent use of recombinant human parathyroid hormone (rhPTH) is the most promising anabolic treatment in osteoporosis, as it increases bone density and decreases the risk of vertebral and non-vertebral fractures in patients with severe osteoporosis (low bone density and prevalent vertebral fractures).

A review of anabolic therapies for osteoporosis

Currently, only one anabolic is FDA approved for treatment of osteoporosis, teriparatide, a recombinant form of endogenous human parathyroid hormone (PTH 1-34). Since its approval in 2002, teriparatide (FORTEO®) has been studied in multiple largescale clinical trials, both alone and in conjunction with antiresorptive drugs.
