Aquatic Geomicrobiology

Welcome to Aquatic Geomicrobiology! Our mission is to explore and understand the world of microbial communities in the environment. We assess functional microbial diversity in aquatic and subsurface environments by molecular approaches to identify key players of biogeochemical processes.

Geomicrobiology is the scientific field at the intersection of geology and microbiology. It concerns the role of microbes on geological and geochemical processes and effects of minerals and metals to microbial growth, activity and survival. Such interactions occur in the geosphere (rocks, minerals, soils, and sediments), the atmosphere and the hydrosphere.

Geomicrobiology - Wikipedia

Microorganisms form the backbone of aquatic environments by controlling the biogeochemical cycling of essential elements such as carbon, nitrogen and phosphorus. In the Geomicrobiology Laboratory, we study microbial processes that mediate the fate of organic compounds in coastal and marine environments.
