### **Chapter 21 Comparing Two Proportions**

The test comparing two independent population means with unknown and possibly unequal population standard deviations is called the Aspin-Welch t-test. The degrees of freedom formula we will see later was developed by Aspin-Welch. When we developed the hypothesis test for the mean and proportions we began with the Central Limit Theorem.

Chapter 8 Bootstrapping and Confidence Intervals. In Chapter 7, we studied sampling. We started with a "tactile" exercise where we wanted to know the proportion of balls in the sampling bowl in Figure 7.1 that are red. While we could have performed an exhaustive count, this would have been a tedious process.

measure inter-rater reliability (and also intra-rater reliability) for qualitative (categorical) items. It is generally thought to be a more robust measure than simple percent agreement calculation, as  $\kappa$  takes into account the possibility of the agreement occurring by chance. There is controversy surrounding Cohen's kappa due to ...

Finally, by comparing two values 7% sales tax is greater than 5% sales tax. b. 0.37 cup of flour or  $\frac{1}{3}$  cup for flour By using the method of converting fraction into decimal and comparing , We can rewrite  $\frac{1}{3}$  as 0.33 in decimal form Finally, by comparing two values 0.37 cup of flour is greater than 0.33 cup of flour.

## Quia - Mathematics

A common problem in applied machine learning is determining whether input features are relevant to the outcome to be predicted. This is the problem of feature selection. In the case of classification problems where input variables are also categorical, we can use statistical tests to determine whether the output variable is dependent or independent of the input variables.

## NSCA chapter 7 Flashcards | Quizlet

Ratios and Proportions Handout Revised @ 2009 MLC page 5 of 10 • Definition: A proportion is a mathematical sentence that states that two ratios are equal. It is two ratios joined by an equal sign. The units do not have to be the same. Some examples: a)  $9 \text{ } 6 \text{ } 3 \text{ } 2 =$  b)  $\$2.80 \text{ } 7 \text{ lbs. } \$2.00 \text{ } 5 \text{ lbs. } =$  c)  $3 \text{ blouses } 8 \text{ } 55 \text{ } 1 \text{ } 2 \text{ blouses } 4 \text{ } 36 \text{ } 3 =$

Numerical Identification of Outliers. In , the first two columns are the third-exam and final-exam data. The third column shows the predicted  $\hat{y}$  values calculated from the line of best fit:  $\hat{y} = -173.5 + 4.83x$ . The residuals, or errors, have been calculated in the fourth column of the table: observed  $y$  value – predicted  $y$  value =  $y - \hat{y}$ .  $s$  is the standard deviation of all the  $y - \hat{y} = \epsilon$  ...
