A1: Digital signal processing includes a program memory which stores all the program the processing uses to process the data. It also includes data memory which stores information within itself which needs to be processed and compute engine which performs the mathematics processing that accessed the program and data from program memory and data memory respectively.

The receiver would bandpass the received signal, pass the result through an A/D converter, perform all the demodulation with digital signal processing systems, and end with a D/A converter to produce the analog message signal. Assume in this problem that the carrier frequency is always a large even multiple of the message signal's bandwidth W .

Digital Signal Processing - NPTEL

Digital signal processing (DSP) is the use of digital processing,
such as by computers or more specialized digital signal
processors, to perform a wide variety of signal processing
operations. The digital signals processed in this manner are a
sequence of numbers that represent samples of a continuous
variable in a domain such as time, space, or frequency.
