Saddle joint - Wikipedia

It arises from the lower two-thirds of the lateral surface of the body of the fibula, medial to the peroneus longus, and from the intermuscular septa separating it from the adjacent muscles on the front and back of the leg.. The fibers pass vertically downward, and end in a tendon which runs behind the lateral malleolus along with but in front of that of the preceding muscle, the two tendons ...

Q Angle - an overview | ScienceDirect Topics

Anatomically, the kinetic chain describes the interrelated groups of body segments, connecting joints, and muscles working together to perform movements and the portion of the spine to which they connect. This idea proposed that movements occurring within each body segment would be capable of "closed-chain" or "open-chain" movement patterns. As an exercise and health professional, it ...

Structure. In a saddle joint, one bone surface is concave while another is convex. This creates significant stability. Movements. The movements of saddle joints are similar to those of the condyloid joint and include flexion, extension, adduction, abduction, and circumduction. However, axial rotation is not allowed. Saddle joints are said to be biaxial, allowing movement in the sagittal and ...
