Practice Problem 4. ... Solution (a) Using a standard-state entropy data table, we find the following information: Compound S°(J/mol·K) Hg(l) 76.02, Hg(s) 174.96. The balanced equation states that 1 mole of mercury vapor is produced for each mole of liquid mercury that boils. The standard-state entropy of reaction is therefore calculated as ...

Some textbooks do not have enough example problems to help students learn how to solve problems. In other books, the examples do not teach the students the underlying method or approach to solving problems. In many courses, the instructor posts copies of pages from the solution manual.

Entropy and the Second Law of Thermodynamics That direction is set by a quantity called entropy Only one of these scenarios happens, so something must be controlling the direction of energy flow. Consider putting some ice into a glass of water. Conservation of energy would allow: • ice getting colder and water getting hotter.

A quantity of ideal gas in an isolated system is expanded isothermally and reversibly at 400 K from a volume V 1 to V 2.

**Entropy Problems And Solutions**  
Key Points. Entropy can be thought of as the randomness or spread-outedness of a group of molecules. Increasing randomness is favorable. There is an entropy change associated with the formation of a solution, an increase in entropy (randomness) that thermodynamically favors the solution over the two original states.

In general, systems tend toward greater entropy; in fact, according to the second law of thermodynamics, the entropy of an isolated system can never spontaneously decrease. This example problem demonstrates how to calculate the change in entropy of a system's surroundings following a chemical reaction at constant temperature and pressure.
