Biochemistry, sometimes called biological chemistry, is the study of chemical processes within and relating to living organisms. Biochemical processes give rise to the complexity of life. A sub-discipline of both biology and chemistry, biochemistry can be divided in three fields; molecular genetics, protein science and metabolism. Over the last decades of the 20th century, biochemistry has through these three disciplines become successful at explaining living processes.

In this method you use a weak chelating agent (Chromazurol S), which has a blue color when bound to iron. If in the solution you have a siderophore or a chelating agent the iron is detached from the CAS and you can see a variation in the color and in the UV-VIS spectrum of the solution.

The focal point of biochemistry and biochemical aspects of toxicants is the cell, the basic building block of living systems where most life processes are carried out. Bacteria, yeasts, and some algae consist of single cells. However, most living things

Environmental Biochemistry

Biochemistry is the study of living things at the molecular level, focusing mainly on the processes that occur. For example, they may study cell development, how cell structure relates to function, how cells communicate with each other to fight disease or regulate an organism's development, and how they metabolize food and oxygen.

The environmental biochemistry group is engaged in studying microbial metabolism of pollutants with emphasis on elucidation of metabolites and critical metabolic reactions. On a molecular level, we analyze enzymes catalyzing key steps in the metabolism of pollutants with regard to genetic, kinetic, and structural criteria.
