Hierarchical Linear Modeling vs. Hierarchical Regression. Hierarchical regression, on the other hand, deals with how predictor (independent) variables are selected and entered into the model. Specifically, hierarchical regression refers to the process of adding or removing predictor variables from the regression model in steps.

There are main two types of data structures : Linear and Non-Linear . In linear data structure the data is organized in linear manner , i.e. one element after other. While in non-linear data structure elements are organized in hierarchical manner . What do you mean by hierarchical manner ? To understand it better, let's consider an example.
