A common task that isolates controlled attention to exclusion of simple memory demands is the Stroop test (Stroop, 1935). In a typical Stroop test, a subject is required to identify the color of a word that is briefly (e.g., 50 ms) presented. In the simple form of this test, subjects' accuracy is normally quite good.

dividing attention on memory depends on how attention is divided. Typically, difficult versus easy auditory monitoring tasks impair memory for words presented at the same time. However, such tasks do not modulate activity in the left inferior prefrontal cortex (LIPC), which is important for the encoding of words into long-term memory [10]. In

### Manipulating Attention Testing Memory The

Four experiments were conducted using an attentional cueing manipulation technique, where memory was tested using direct and indirect memory tests. The results showed that exogenous and endogenous cueing manipulations have a beneficial effect on memory when measured using a direct memory test, but have little or no effect on memory when assessed with an indirect test of memory.
