Meerkats - Wild Animals News & Facts by World Animal ...

Females give birth to one to eight babies at a time, but it is more common for meerkat mothers to have three to four offspring at a time. The babies, called pups, are born underground, where they...

Meerkat Match

The meerkat uses its tail to balance because it stands up on its back legs to look for animals that would eat it. Round the eyes are black patches which lessen the bright light that comes into its eyes. Meerkats have long claws that help them dig and fight. The back of the meerkat is furry and it has stripes to help it not be seen by predators. The front side is black and has no fur because it needs to get warm in the morning to be ready for the day.

It seems Sergei is give into his midnight cravings for Creature Crisps and Beetle Bits a little too often. His bloated beetle belly means his meerkat toy Sergei is now completely inaccurate! This ...

MEERKAT - World Animal Foundation

A very keen sense of smell enables meerkats to locate prey, which they will dig out, using their long-clawed forefeet. A meerkat can move 50 times its body weight of sand and dig 400 holes in just half a day. The black patches around a meerkat's eyes help protect it against the sun's constant glare, rather like sunglasses for a human.

Meerkat | Meerkats Wiki | Fandom

Young meerkats play fight to learn and to practice their skills, while adults use it to establish dominance within the gang. Although the dominant female is the only female allowed to breed in the meerkat community, she's responsible for only 80 percent of litters produced [source: National Geographic]. Meerkats reach sexual maturity right around their first birthday, and some beta females will become pregnant before leaving the gang.

Meerkat - Facts, Diet, Habitat & Pictures on Animalia.bio

Meerkats usually mate throughout the year, but mate more frequently during the warmer months when there is rain. In the wild most births are between August to March. Meerkats are dioecious meaning that they have separate sexes. Meerkats are also viviparous which means the embryo develops in the mother.
