You can search Google Books for any book or topic. In this case, let's go with "Alice in Wonderland" since it's a well-known book, and there's probably a free eBook or two for this title. The original work is in the public domain, so most of the variations are just with formatting and the number of illustrations included in the work. However, you might also run into several copies for sale, as reformatting the print copy into an eBook still took some work. Some of your search results may also be related works with the same title.

These tests use a colorimetric analysis method to measure the P extracted from the soil. This method is based on the intensity of a blue color that develops after adding appropriate chemicals to the soil extract. The M3 and Bray-1 P tests measure approximately the same amount of P in acid or neutral soils.

Soil analysis reports for vineyards usually indicate Zn -, Mn -, B - and copper (Cu) - contents in mg/kg. In cases where Zn - and B - contents in the soil are below 0,5 mg/kg, and Mn - contents below 5 mg/kg, shortages may occur. In such cases the vineyard should be monitored visually for symptoms of shortages.

Five chapters are devoted to methods to determine the various forms of nitrogen in soil, including total, organic, inorganic, urea, and methods for isotope ratio analysis. Methods for characterization and enumeration of specific groups of soil microorganisms, as well as methods for analyzing soil microbiological activity, are extensively covered in this edition.

Water holding capacity is determined by keeping fresh soil overnight with water at a 1:2 ratio in a filter funnel plugged with glass wool and stoppered. The stopper is then removed and the soil allowed to drain for 3 hours. The water content of the saturated soil is then determined using method 104(ii).
