AN INTRODUCTION TO MULTIVARIATE STATISTICS

Chapter 1 Basic Concepts for Multivariate Statistics 13. An n by n matrix A is said to be an orthogonal matrix if. $A A^T = A^T A = I_n$. This necessarily is equivalent to saying that all rows (or columns) of A are orthonormal to one another.

M.S. Srivastava's Methods of Multivariate Statistics

Multivariate analysis consists of a collection of methods that can be used when several measurements are made on each individual or object in one or more samples. We will refer to the measurements as variables and to the individuals or objects as units. (research units, sampling units, or experimental units) or observations.

Multivariate analysis is used to study more complex sets of data than what univariate analysis methods can handle. This type of analysis is almost always performed with software (i.e. SPSS or SAS), as working with even the smallest of data sets can be overwhelming by hand. Multivariate analysis can reduce the likelihood of Type I errors.
