How to analyze Likert type dependent variables
I have read multiple articles that discuss the analysis of Likert based data, but can't find a test that fits with my data. I have tried Ordinal Regression, but seeing as I get very high numbers I believe the results are biased.

Likert Scale Items as Predictor Variables in Regression ...
I have data in likert scale (1-5) for dependent and independent variables. I have done some research to check whether likert scale data can be used in regression analysis.

Moderated Regression Analysis And Likert Scales Too Coarse
These Likert-type variables are sometimes used in ordinary least-squares regression analysis. However, among the key implications of the assumptions of regression is that the criterion is continuous. Little research has been done to examine how much information is lost and how inappropriate it is to use Likert variables in ordinary least-squares multiple regression.

Here's my reply. In the question, the researcher asked about logistic regression, but the same answer applies to all regression models. 1. There is a difference between a likert scale item (a single 1-7 scale, eg.) and a full likert scale , which is composed of multiple items.

dependent-response scale on moderated regression results when subjects were known to be providing a "true" interaction effect. This would provide an empirical extension of Russell et al.'s (1991) limited simulation and more conclusive evidence about the impact of Likert-type scales in moderated regression analyses.

Saunders (1955, 1956) was the first to describe stepwise or hierarchical moderated regression analysis as a means of empirically detecting how a variable "moderates" or influences the nature of a relationship between two other variables. Statistical textbooks (e.g., Cohen & Cohen, 1983) have introduced later generations of investigators to the procedure.

Appropriate Moderated Regression and Inappropriate ...
Moderation analysis in the behavioral sciences involves the use of linear multiple regression analysis or causal modelling. To quantify the effect of a moderating variable in multiple regression analyses, regressing random variable Y on X, an additional term is added to the model.This term is the interaction between X and the proposed moderating variable.

However, many authors have expressed concern over the general lack of empirical support for interaction effects reported in the literature. We demonstrate in the current sample that use of a continuous, dependent-response scale instead of a discrete, Likert-type scale, causes moderated regression analysis effect sizes to increase an average of 93%.
