Physiology of the Skin Third Edition - Circadia UK

The skin is composed of three layers: the epidermis, the dermis, and subcutaneous tissue (Kanitakis, 2002). The outer most level, the epidermis, consists of a specific constellation of cells known as keratinocytes, which function to synthesize keratin, a long, threadlike protein with a protective role.

Skin Burns - Anatomy and Physiology

The skin is the body's largest organ - an average adult's skin has a surface area of approximately 1.67m² and weighs around 4-5kg (Marieb and Hoehn, 2015). Skin is a malleable but tough structure, serving as a bag holding in all the body's contents; without it, we would quickly succumb to water and heat loss, and pathogen invasion.
