Glossary of engineering - Wikipedia

Centrifugal pumps are used to transport fluids by the conversion of rotational kinetic energy to the hydrodynamic energy of the fluid flow. The rotational energy typically comes from an engine or electric motor. They are a sub-class of dynamic axisymmetric work-absorbing turbomachinery. The fluid enters the pump impeller along or near to the rotating axis and is accelerated by the impeller ...

Euler's turbomachine equation, or sometimes called Euler's pump equation, plays a central role in turbomachinery as it connects the specific work Y and the geometry and velocities in the impeller. The equation is based on the concepts of conservation of angular momentum and conservation of energy.. The Euler's turbomachine equations are: Shaft torque: $T_{\text{shaft}} = \rho Q (r_2 V_{t2} - r_1 V_{t1})$
