Penny Decay Radioactive decay follows 1st order kinetics and in the reaction, the concentration of the reactant decreases exponentially. The rate of the reaction equals the concentration of the reactant, [A], raised to the first power times a proportionality constant, k, which is called the rate constant.

the question is what happens to the simulated rate of decay as the number of pennies decrease? In this lab, we had 100 pennies. We flipped them and we then separated the heads from the tails. The 100 pennies represented radioactive matter before any half lives. The heads represented the decayed after a half life, and the tails represented the un-decayed matter after a half life.

Analyze the Results: In the Analysis, students answer questions about the data and plot a graph of the number of remaining coins versus the number of shakes. Draw Conclusions: In the Conclusions, students use the pennies as a model, determine the half-life of the pennies, and compare the decay of the pennies to the radioactive decay of carbon-14.

In this model, the removal of a penny or a cube corresponds to the decay of a radioactive nucleus. The chance that a particular radioactive nucleus in a sample of identical nuclei will decay in each second is the same for each second that passes, just as the chance that a penny would come up tails was the same for each toss (1/2) or the chance that a cube would come up red was the same for ...
