Notice that μ_1 , and μ_2 depend on the choice of the origin for the coordinate system because the EDA system total charge is not zero. This does not concern us since one can always shift the energy reference point.

"THE solution of the eigenvalue equation ($V_2 + (1)$) is a subject of profound importance in many areas of physics and engineering, the most important being quan-tum mechanics and optical waveguide theory [1], [2]. When (1) is not amenable to exact solutions, one usually resorts to one of the three approximate methods: pertur-

Equilibrium and nonequilibrium solvation and solute ...

The classical dynamics of an electron moving in the presence of two equally charged, fixed nuclei is presented. The manner in which the values of the three constants of the motion determine the qualitative features of the electronic trajectory is discussed. Primitive semiclassical wavefunctions and quantization conditions for the Born-Oppenheimer electronic quantum states of H_2^+ are derived ...
