Soil fertility management and insect pests: harmonizing soil and plant health in agroecosystems Cultural methods such as crop fertilization can affect susceptibility of plants to insect pests by altering plant tissue nutrient levels.

Integrating soil fertility, host-plant resistance and ...

With biological soil fertility, your plants won't be a magnet for pest insects and will be better equipped to fend off whatever pest insects they might encounter (especially if aided by predatory insects in your garden/farm system). A predatory lacewing larva gobbles up an aphid (a pest insect) in our garden. No human intervention required.

good soil fertility. Crops grown in such soils generally exhibit lower abundance of several insect herbivores, reductions that may be attributed to a lower nitrogen content in organically farmed crops. On the other hand, farming practices, such as

Besides the relation between soil fertility and crop productivity, most soil fertility management methods used by farmers can also be considered pest management strategies and vice versa [14]. Progressively, novel research is showing that the ability of a crop plant to resist or tolerate insect pests and diseases is positively correlated to optimal physical, chemical and mainly biological properties of soils [14].

Soil fertility management and insect pests: harmonizing ...

In organic farming, enhancement of soil fertility is accomplished through rotations, cover cropping, and the application of plant and animal materials. This article addresses some of the main elements of soil management that can help to reduce insect pest problems, including soil and fertility management, use of mulches, and sanitation.

Soil Fertility Management And Insect

Soil fertility management can have several effects on plant quality, which in turn, can affect insect abundance and subsequent levels of herbivore damage. The reallocation of mineral amendments in crop plants can influence oviposition, growth rates, survival and reproduction in the insects that use these hosts (Jones, 1976). Although more research is needed, preliminary evidence suggests that fertilization practices can influence the relative resistance of agricultural crops to insect pests.

2019 Integrated Crop and Pest Management Update ...

With more research regarding the relationship between soil fertility and insect pest attack, we will be better placed to convert conventional systems of crop production to those that incorporate agroecological strategies to optimize soil organic fertilization, crop diversity management, and more natural systems of pest regulation without incurring yield penalties.
