Figure 1. Cerebrospinal fluid is produced within the ventricular system by the choroid plexus and transependymal flow. It then circulates (arrows) through the foramina of Luschka and Magendie, around the basal cisterns and spinal cord, and up and over the cerebral convexities to be reabsorbed into the superior sagittal sinus through arachnoid granulations.

Imaging plays an essential role in the evaluation of patients after cranial surgery. It is important to be familiar with the normal anatomy of the cranium; the indications for different surgical techniques such as burr holes, craniotomy, craniectomy, and cranioplasty; their normal postoperative appearances; and complications such as tension pneumocephalus, infection, abscess, empyema ...

Imaging of the Post-operative Cranium | RadioGraphics

Diagnosis. To diagnose a subarachnoid hemorrhage, your doctor is likely to recommend: CT scan. This imaging test can detect bleeding in your brain. Your doctor may inject a contrast dye to view your blood vessels in greater detail (CT angiogram).
